Uzbek-Finnish Institute*

**Annotation:** *this article analyzes the importance of using national values in increasing the effectiveness of students' learning activities. According to the research findings, an education system harmonized with national values has a positive impact not only on the process of learning, but also on personal and professional development.*

**Keywords:** *national values, effectiveness of learning activities, motivation, national pride, social activity, educational methods, psychological adaptation.*

The role of national values in the educational process is important for the intellectual and personal development of students. These values, enriching the practical aspects of education, not only increase students' knowledge, but also strengthen their motivation for personal responsibility, awareness of national identity and benefiting society. In this sense, criteria are defined as indicators of effectiveness that show students' ability to achieve practical results from theoretical knowledge.

In addition, the use of national values in the educational process strengthens mutual trust, respect and cooperation among students. They form a positive attitude towards the cultural heritage of society, which, in turn, leads to an increase in internal motivation to study. These changes are also positively reflected in social relations, because students learn to apply high moral standards in communication, help each other and correctly understand their responsibility to society.

As a result of such changes, the effectiveness of educational activities increases. By integrating national values into the educational process, students begin to understand theoretical knowledge more deeply, become ready to solve problems independently, and also develop skills to apply innovative approaches in professional activities. At the same time, social activity among students increases, they strengthen their skills by participating in cultural projects and create a foundation for future professional success.

Through the effectiveness of the use of national values, students further strengthen their personal potential, rely on cultural and spiritual values, and strive to take a worthy place in society. In this way, at each stage of the educational process, students achieve high results not only in acquiring knowledge, but also in successfully fulfilling their

personal and social tasks. This is an important step in increasing the overall efficiency of the education system.

Thus, the integration of national values into the educational process not only forms a national identity in the minds of students, but also serves to increase the sense of responsibility for the educational process. The use of national values in improving the effectiveness of education allows students to be socially active, respectful of cultural heritage, able to think innovatively and ready to be professionally successful in the future. This process is of strategic importance not only for students, but also for increasing the overall effectiveness of the education system. As a result of the active use of national values in the educational process, the consistency, strength and depth of the assimilation process increases. Students strengthen their skills in applying their knowledge in real-life situations, forming the ability not only to memorize topics, but also to analyze, compare and find innovative solutions. The active reflection of national values in the educational process not only increases the effectiveness of the traditional model of providing knowledge, but also serves to develop students' critical thinking, analytical approaches and independent decision-making skills.

In this process, students develop social interaction skills by working with their team, communicating, participating in debates and discussions. This approach serves to develop their initiative, creativity and teamwork skills, which is an important factor in their professional development. Students who receive education in an educational environment based on national values clearly understand their place in society, form their professional aspirations and have the opportunity to clearly define their future goals.

In addition, the educational model based on national values strengthens the motivation system, as students associate their personal development not only with individual success, but also with being useful to society. In the process of personal self-awareness, a sense of national pride is formed, and in the process of education, a sense of self-worth and self-confidence in the professional direction increase. Students who have a deep understanding of their national values will be able to successfully integrate into foreign educational systems or the international arena without losing their national identity.

Through the effective implementation of educational methods based on national values, students develop strategies for solving life problems, take a more responsible approach to their professional activities, and associate the educational process not only with obtaining knowledge, but also with benefiting society. This leads to a deeper integration of the education system into society, an increase in social responsibility and professional maturity among students.

The results of assessing the effectiveness of education based on national values show that with the help of such an approach, students:

deepen their knowledge and improve their skills in applying it in practical activities;

acquire their own personal vision and approach to their professional field;  
increase their sense of social responsibility and national pride, which leads to their being more active in the educational process;  
develop leadership skills and become ready to take the initiative in their professional fields;  
form the ability to quickly adapt to different cultural contexts.

In this regard, the impact of the use of national values on the effectiveness of education leads to significant results not only at the individual level, but also at the societal level. Such an approach determines the direction of professional development of the future generation, increases their social activity and strengthens their responsibility to society.

An educational system based on national values serves not only to harmonize the learning process of students with modern approaches, but also to develop their ability to develop new approaches in their future professional activities, using their own cultural heritage. Therefore, a deeper study of the psychological mechanisms of the use of national values and their wider application in the educational process should be an integral part of future educational strategies.

Such an educational model opens the door to new opportunities for students, strengthens their enthusiasm for the educational process, and creates an important foundation for their formation as responsible professionals in the future.
