the Uzbek-Finnish Institute*

Annotation: *this article analyzes the importance of using national values in increasing the efficiency of students' academic activities. According to the research findings, an education system harmonized with national values has a positive impact not only on the process of knowledge acquisition, but also on personal and professional development.*

Keywords: *national values, academic efficiency, motivation, national pride, social activity, educational methods, psychological adaptation.*

The use of national values to improve the effectiveness of students' academic performance has been studied within the framework of various scientific approaches, in which psychological, pedagogical and sociological factors are the main objects of research. National values are an integral part of the educational process, which significantly affect aspects such as students' motivation, level of self-awareness, cultural identification, and professional and social development. By studying these factors on a scientific basis, effective ways of integrating national values in the education system are identified.

Empirical and theoretical approaches are used to study how national values affect the educational process. Empirical studies assess students' motivation in the educational process, social adaptation, and attitude to national values. Observations and experiments are used to study how national values affect educational performance among students. Theoretical studies, based on pedagogical and psychological theories, explain the process of development of an individual in his cultural environment.

From a psychological perspective, L. Vygotsky's theory of cultural-historical development shows how the study of national values in the educational process plays a role in shaping the thinking of an individual. Also, according to Bandura's social-cognitive theory, people adapt their actions to the values and cultural factors in society. These approaches help explain how national values are instilled in students' minds during the educational process and how they affect their personal development.

From a pedagogical point of view, educational methods based on national values serve to develop social interaction, independent thinking, and professional aspirations among students. Modern educational research shows that integrating national values into the educational process increases students' desire for knowledge, encourages their participation in social activities, and forms a sense of national pride.

MODERN PROBLEMS IN EDUCATION AND THEIR SCIENTIFIC SOLUTIONS

As a result of research, the following aspects of national values in the educational process have been identified: students are more motivated to learn, knowing their culture and values, educational methods based on national values increase their sense of social responsibility, and this approach facilitates the process of preparing for their future professional life.

According to the sociological approach, national values affect the process of increasing social adaptability among students, strengthening group cohesion, and forming attitudes towards society. The role of national values in the life of society has been studied in depth, and they determine the social, moral, and spiritual aspects of individual development. Hofstede's theory of cultural dimensions helps to analyze the role of national values in the development of society and the individual.

Studies have shown that national values contribute to students' understanding of their place in the educational process, maintaining social stability, and improving academic performance. Therefore, it is important to deeply study the psychological and pedagogical possibilities of using national values in the education system. According to the results, the educational process based on national values creates such changes as increased motivation among students, the formation of professional and personal aspirations, increased social activity, and increased respect for cultural heritage.

Studies on the implementation of national values in the educational process confirm that this process is an important factor in increasing the effectiveness of knowledge acquisition among students. In addition, the introduction of national values in the educational system ensures not only the academic development of students, but also their social and spiritual maturity.

Therefore, to increase the effectiveness of the education system based on national values, it is necessary to implement modern pedagogical technologies and psychological methods, use interactive teaching methods, and adapt the learning process to the needs of students. This will not only improve the process of students' learning, but also serve to increase their responsibility to society and strengthen their preparation for future professional activities.
